Getting started with Maven

Create Java project

mvn archetype:generate

- -DgroupId=org.yourcompany.project
- -DartifactId=application

Create web project

mvn archetype:generate

- -DgroupId=org.yourcompany.project
- -DartifactId=application
- -DarchetypeArtifactId=maven-archetype-webapp

Create archetype from existing project

mvn archetype:create-from-project

Main phases

clean — delete target directory

validate — validate, if the project is correct

compile — compile source code, classes stored
in target/classes

test — run tests

package — take the compiled code and package it in its distributable format, e.g. JAR, WAR

verify — run any checks to verify the package is valid
and meets quality criteria

install — install the package into the local repository

deploy — copies the final package to the remote repository

Useful command line options

- -DskipTests=true compiles the tests, but skips running them
- -Dmaven.test.skip=true skips compiling the tests and does not run them
- –ਾ number of threads:
 - -т 4 is a decent default
 - -т 2c 2 threads per CPU
- -rf, --resume-from resume build from the specified project
- -p1, --projects makes Maven build only specified
 modules and not the whole project
- -am, --also-make makes Maven figure out what modules out target depends on and build them too
- -o. --offline work offline
- -x, --debug enable debug output
- -P, --activate-profiles comma-delimited list of profiles to activate
- -U, --update-snapshots forces a check for updated dependencies on remote repositories
- -ff, --fail-fast stop at first failure

Essential plugins

Help plugin — used to get relative information about a project or the system.

mvn help:describe describes the attributes of a plugin mvn help:effective-pom displays the effective POM as an XML for the current build, with the active profiles factored in.

Dependency plugin — provides the capability to manipulate artifacts.

mvn dependency:analyze analyzes the dependencies
of this project

mvn dependency: tree prints a tree of dependencies

Compiler plugin — compiles your java code.

Set language level with the following configuration:

<plugin>

Version plugin — used when you want to manage the versions of artifacts in a project's POM.

Wrapper plugin — an easy way to ensure a user of your Maven build has everything that is necessary.

Spring Boot plugin — compiles your Spring Boot app, build an executable fat jar.

Exec — amazing general purpose plugin, can run arbitrary commands:)
